ABSTRACT

Objective: surveying the scientific literature about the use of alcohol, tobacco and other drugs among students, involving the School Health Program (PSE). Method: a descriptive, retrospective and bibliometric study from the literature review in Lilacs, Adolec and SciELO. They were selected through inclusion/exclusion criteria, 18 articles published between 2008 and 2014. Results: most articles are indexed in the Lilacs, are unique, quantitative, and conducted with adolescents and without approaching the PSE as a promotion proposal to health and prevention of alcohol, tobacco and other drugs among students. Conclusion: there is no need to conduct studies that show actions that can be performed in the school environment together with students, families and society, and be worked in different ways the theme: alcohol, tobacco and other drugs. Descriptors: School Health; Tobacco; Alcohol Drinking; Bibliometric Indicators; Scientific Communication and Diffusion.

RESUMO

Objetivo: realizar o levantamento da produção científica sobre o uso de álcool, tabaco e outras drogas entre escolares, associado ao Programa Saúde na Escola (PSE). Método: estudo descritivo, retrospectivo e bibliométrico realizado a partir da revisão da literatura na Lilacs, Adolec e SciELO. Seleccionaram-se, por meio de critérios de inclusão/exclusão, 18 artigos publicados entre 2008 e 2014. Resultados: a maioria dos artigos está indexada na Lilacs, são originais, quantitativos, realizados com adolescentes e sem abordar o PSE como proposta de promoção à saúde e prevenção do uso de álcool, tabaco e outras drogas entre escolares. Conclusão: há necessidade de realizar estudos que apresentem ações que possam ser realizadas no ambiente escolar em articulação com estudantes, famílias e sociedade, e que sejam trabalhadas de diversas formas a temática: álcool, tabaco e outras drogas. Descritores: Saúde Escolar; Tabaco; Consumo de Bebidas Alcoólicas; Indicadores Bibliométricos; Comunicação e Divulgação Científica.

RESUMEN

Objetivo: llevar a cabo el estudio de la literatura científica acerca del consumo de alcohol, tabaco y otras drogas entre los estudiantes, con la participación del Programa de Salud Escolar (PSE). Método: un estudio descriptivo, retrospectivo y bibliométrico de la revisión de la literatura en las Lilacs, Adolec y SciELO. Ellos fueron seleccionados a través de criterios de inclusión/exclusión, 18 artículos publicados entre 2008 y 2014. Resultados: la mayoría de los artículos está indexada en Lilacs, son originales, cuantitativos, realizados con adolescentes y sin abordar el PSE como propuesta de promoción a la salud y la prevención del uso de alcohol, tabaco y otras drogas entre los estudiantes. Conclusión: es necesario llevar a cabo estudios que presenten las acciones que se puedan realizar en el entorno de la escuela junto con los estudiantes, las familias y la sociedad, y se trabajan de diferentes maneras el tema: alcohol, tabaco y otras drogas. Descriptores: Salud Escolar; Tabaco; El consumo de alcohol; Indicadores Bibliométricos; Comunicación y Difusión Científica.

The individual or combined use of alcohol, tobacco and other drugs used by schoolchildren is an actual and necessary issue because it is a public health problem in Brazil, which both society and the family and the school need to contribute in a coordinated way towards the reduction of this disease of biopsychosocial nature. One approach to contribute to minimizing this problem is from conducting research and publications that show since risk factors, the funding for the planning of public policies and programs that can develop initiatives to the theme.

This study will be treated from the survey of the scientific production that was addressed as main subject the use of alcohol, tobacco and other drugs by school, after the drafting of the School Health Program (PSE). It will also be checked if the articles discuss how proposals to promote health and reduce problems arising from the use of these substances among school children, actions described in the PSE.

In Latin America, it is imperative to point out that alcohol consumption is the first risk factor for disease and premature death, still more important than other factors such as smoking, hypercholesterolemia, obesity or malnutrition.¹ Among the consequences caused by alcohol consumption, can cite the short-term damage and problems such as: traumatic car accidents, violence and aggression, sexual activity, unprotected or unwanted and accidental deaths.²

In referring in particular teenagers and young community, it should be noted that it is the school that brings much of this population and that is where they spend most of their time. Therefore, health professionals need to promote interventions in an inter-institutional partnership, to approach these individuals and act to prevent the use of psychoactive substances.³

As a proposal to prevent the use of alcohol, tobacco and other drugs among students, the PSE was created, the Ministry of Health and the Ministry of Education established in 2007, by Presidential Decree nº 6286, of December 5th, 2007, this program, which aims to contribute for the integral formation of students through promotion, prevention and health care, with a view to addressing the vulnerabilities that compromise the full development of children and youth education from public.⁴

The PSE was established as an inter-sectoral policy, in order to pay attention focused on the health of children, adolescents and young people of basic public education within schools and basic health units, carried out by teams of health and education, in an integrated way. This program's main objectives: stimulating the development of actions at school aimed at the practice and preservation of health as a social and cultural well-being; identifying and preventing problems and risks to health, which hinder the learning process; contributing to the school and the community in which it operates to become environments which physical, mental and social development of the school; encouraging the participation of all those who make up the schools and in society in general in improving health as a whole.⁴

Understanding the stages of childhood and adolescence as a vulnerable period for the acquisition of habits and risk behaviors that may be reflected in adulthood; the legal and illegal drugs are causes of social problems; and that the PSE is essential in the context of primary health care, jobs that address these issues are relevant to bring an analysis of scientific knowledge that articulates these issues with each other and are available in databases.

In line with the shortage of work involving legal and illegal drugs, justified the preparation of this study, encouraging new possibilities for action to protect the health of adolescents from the profile of scientific production found in the bibliometric analysis.

From the context, the study aims to survey the scientific literature on the use of alcohol, tobacco and other drugs among students joining the School Health Program.

**METHOD**

It is a study of a bibliometric, descriptive and retrospective type. The bibliometric research is supported by studies in bibliographic databases, indexes and abstracts, directories and periodical titles books, references and citations. In short, this kind of research is through the study of quantitative aspects of production, dissemination and use of information published⁵, relevant for providing evaluation indicators of scientific production on a certain theme.

The study was conducted through literature review conducted in the Virtual Health Library, from the databases LILACS (Literature in Health Sciences), Adolec (Adolescent Health and young people in Brazil) and virtual library SciELO (Scientific Electronic Library Online). To search for articles descriptors
were used: "school health", "school health and drinking", "school health and tobacco".

The selection criteria for inclusion of the articles used in this review were: being full national articles with abstracts available in selected bases; available for free that addressed as main theme the consumption of alcoholic beverages or tobacco and/or other drugs in school up to high school, because the PSE covers up to this target audience and is associated with the health of the school. In addition to these criteria, it established the time frame 2008 to April 2014 in order to include in this review only research carried out after the preparation of the PSE in order to determine whether those studies addressed the said program and/or educational activities established by this as proposed for promoting health and preventing the use of alcohol, tobacco and other drugs.

Prior to the establishment of the exclusion criteria, there were found 127 publications. These publications have excluded up those who tried to alcohol consumption and other drugs; however, they were associated with other aspects such as the influence: the family, the media, some mental disorders not related to school health, given that the Study focus is school, target of the PSE. From these exclusion criteria there were considered for this review 18 articles. The selection of items was initially performed from the search for the descriptors in the title or abstract and, where appropriate, consulted the text.

For possession of material for analysis, the following steps were followed: reading material and selection of those who met the inclusion criteria, being careful to compare them in the three databases, Lilacs, Scielo and Adolec, to see which publications were repeated; a guide with the characteristics of the study and other variables of interest; subsequently, the analytical reading was held, critical and detailed texts, extracting from them the results that are believed more relevant to characterize the scientific production related to the theme.

From reading the articles there were analyzed bibliometric indicators present in the index fields, supplied from below, detailing the following: database where the publication was indexed; Professions of the first authors; type of study; method used; gender of participants; age; Brazil region in which the survey was conducted; periodic they were published; year of publication; in addition to the summary of the characterization of the articles used by synoptic figure containing the issues addressed, objectives, main results and conclusions.

RESULTS AND DISCUSSION

From the selected descriptors 127 articles were identified and with the use of the exclusion criteria 109 articles were disposed. Thus, the study sample included 18 articles for analysis. In the three bases of data consulted - Lilacs, Scielo and Adolec - various articles overlap, appearing in two parallel bases. Still, most of the research on alcohol, tobacco and other drugs are in the Lilacs and Scielo (55,5%), Lilacs (17%), Adolec (16,5%) and Scielo (11%)

When checking the professions of the first authors of the articles, it is observed that mostly was not identified in the articles (71,5%), moreover, there was a diversity of professions, nurse (5,5%), psychologist (5,5%), doctor (5,5%), dentist (5,5%) and pharmacist (5,5%).

Regarding the types of studies found, the majority (83,5%) was original articles, followed by review articles (11%) and experience reports (5,5%). Regarding the method, it was found that all the original articles were quantitative (83,5%), followed by theoretical articles (16,5%). Note that some items did not tell clearly the design of the survey; however, from the characteristics of the participants, instruments and data analysis conducted made possible this classification.

Significantly, regarding the gender of the participants surveyed in Articles - when original - it was noted that both were female and males (94,5%) and small percentage of research does not appear in this information (5,5%).

Still referring to the participants of the research, it is noted that, according to age established by the World Health Organization (WHO), most research was conducted with adolescents between 12 and 18 years old (39,5%), followed by children and adolescents aged 1 to 18 (22%), adolescents and young adults between 12 and 25 (16,5%); caveat is that of the articles presented this information insufficient (11%), unidentified (5,5%) and a lesser percentage was attended by children, adolescents and young adults (5,5%).

Regarding the region in Brazil in which was published the issue under study, it is noted that the majority (28%) covered the 26 Brazilian state capitals and the Federal District. The other articles, the region that it was published over the South (28%), followed by the Northeast (22%) and Southeast (16,5%), with small production in the Midwest region.
(5.5%) and being not identified productions in the North.

There was a wide diversity in the journals in which the articles were published from 2008 to 2014; however, there is a greater distribution in the Public Health Notebook (16.5%) and Public Health Journal (16.5%). Concerning the year of the reports analyzed, it was found that the sum of the years of 2010 and 2011 represented the highest percentage (44%), the remaining years ranged from (5.5%) to (16.5%) of the publications in the period studied. Table 1 shows the distribution by periodic, the number of articles published each year.

Table 1. Number of articles published annually by journal, in the period from 2008 to 2014. Jequié - BA, Brazil, 2014.

The addressed themes in articles mostly (33.5%) emphasize the alcohol, followed by tobacco (28%), alcohol, tobacco and other drugs (22%) and alcohol and tobacco combined with other drugs (16.5%). Regarding the approaches of the analyzed articles by associating the use of the aforementioned substances to the health of school and PSE, there was a minimal amount of articles (11%) than quoting the program, despite the theme being directed to school, target audience of this program.

The objectives of the articles, and their main results discussed related to prevalence, exposure, consumption, characterization, occurrence and factors associated with use of some of the above drugs, either separately or in combination and, among the conclusions been seen that the majority addressed the importance of school, for promoting health and preventing the use of alcohol, tobacco and other drugs, as can be seen from figures 1, 2, and 3.

English/Portuguese

1276
Alcohol use among adolescent students is, in most cases, experimental, but must be closely monitored and discouraged by several factors. However, the results presented above reveal how alcohol consumption among school children has become increasingly common. The consumption of alcoholic beverages is also related to the occurrence of negative consequences. Among the students, many reported having hangover, get sick, have problems with family or friends, miss school or engage in fights.

Therefore, it is of fundamental importance the role of schools to monitor these young people, in order to guide and discuss the issues and consequences related to the use of alcohol and other drugs, seeking strategies and aimed at strengthening the prevention of health problems such school.

It is necessary that the school is committed to social and cultural issues of each student, because he lives in society, so should receive guidance on issues arising from his behavior, the use of alcohol, which is getting earlier and in greater often Thus, these young people should be targets of public policies for the promotion and prevention of early and excessive use of alcohol and these policies should also be implemented in schools.

Figura 2. Characterization of tobacco studies according to authors, topic, and objectives, key results and conclusions. Jequié-BA, Brazil, 2014.
Smoking is usually associated with the use of alcohol and other drugs. It was observed that in given research, the prevalence of adolescents who reported having smoked in the past thirty days was higher among those who have experienced alcohol, had sex and had used drugs at least once in life and those who consumed at least one dose of alcohol in the last thirty days. 13

The results found in a study conducted in Florianópolis19 demonstrated that, on the initiation to smoking, most of the boys and nearly half of school girls experienced longer smoke up to 13 years old. The same results were found in other Brazilian cities, showing that women are starting to smoke earlier.

Another important finding is that one-third of those who tried smoking at least once in life became a regular smoker. The authors found that this way, the school and the health teams, including nursing schools through PSE has a prominent role in smoking prevention among other drugs.

Among the articles analyzed, few mentioned the PSE prepared program because of the need for coordination between the area of health and education, a tool capable of providing better health and quality of life of the school. But there has been from the main findings and conclusions of the research that tobacco use can be prevented through health actions carried out in school.

<td>Use of alcohol, tobacco and other drugs by adolescents in school of southern Brazil municipality.</td>
<td>1,170</td>
<td>Studying the behavior of the students of the 7th grade of the municipal public education of Gravataí, Rio Grande do Sul, Brazil, in relation to the consumption of alcohol, tobacco and other drugs, as well as assess the association with family, group of friends, nutritional status and emotional aspects of young people, in the year 2005.</td>
<td>There were found, respectively, (60.7%), (16.9%) and (2.4%) for use in liquor, tobacco and other drugs. In the last thirty days, alcohol also showed the highest prevalence (33%), followed by tobacco (4.4%) and other drugs (0.6%). The study revealed the importance of family and friends in the experimentation of substances by young people.</td>
<td>Health professionals should be inserted in this context, working in conjunction with the school in the development of health education activities, directed to the teenager and his family, and in the planning of policies directed to the construction of protective and healthy environments to enhance the quality of life of the students and of the community.</td>
</tr>
</tbody>
</table>

The family's role in preventing the use of alcohol, tobacco and other drugs, is discussed in some articles included in this review, however, not only as a protective factor, but also of influence experimentation and continued use of these substances.

Family practices, as do at least one meal with parents or guardians, five or more times a week, and the fact that parents or guardians know what teenagers do in their free time in the last 30 days, that is, the family supervision has protective effect for the adolescent18.
Aspects of health promotion and prevention against the use of alcohol, tobacco and other drugs cannot be directed only to school, because these aspects are intrinsically linked to adolescent family. So it is important to articulate this work with the Family Health Strategy, so that we can involve the whole community in this reflection in search for a better quality of life for students.

Given this perspective, it is valid to point out that the work done at school that encompasses health promotion and prevention of alcohol, tobacco and other drugs, must involve both the family and society, not emphasizing only the students, because of their habits, customs and behaviors are not limited to the school environment.

Figure 4. Characterization of the studies on alcohol or tobacco associated with other drugs according to the authors, topic, number of sample, objectives, key results and conclusions. Jequié- BA, Brazil, 2014.
These results confirm that smoking is configured as a gateway to the use of other drugs. It is a public health problem and the leading preventable cause of death and health problems. It was found that there is a strong association between smoking and the use of alcohol and other drugs, especially among public school pupils, they emphasize that smoking prevention should be a priority in any intervention strategy.

Involvement in situations of physical violence remained significantly associated with bullying, and alcohol consumption and drug use both for males as for females.

From the main findings discussed in the articles, it is clear that health promotion strategies and prevention of alcohol, tobacco and other drugs in school just been addressed. A few articles mentioned the role of the school health school emphasizing more the prevalence, risks and consequences of using these substances.

Among the vulnerabilities that students to use alcohol and other drugs are exposed can be cited as an example: miss more classes, participate more fights, and more risk to HIV/AIDS. The profile of adolescent students when tracing can help in planning the actions of the professionals involved with the ESP as well as assist in the development of projects that integrate health and education in developing actions. These actions near the school community, enabling addressing the issues related to the use and abuse of alcohol or other drugs beyond the walls of the same.

The use of alcohol and drugs is associated with several risk factors, causing damage to health and life of adolescents, thus the share of families, schools and society to draw up measures to promote health and prevent the use of these substances, set up an emergency measure.

CONCLUSION

It was noted from the study liking for building research that addresses the use of alcohol, tobacco and other drugs, more broadly, giving emphasis to the school. It should be mentioned that, unanimously, the approach used in the original articles was qualitative; so it would be important for qualitative research were developed for this target audience in order to understanding the subjective questions that are risk factors for the use of these substances.

Regarding the use of available resources in the databases LILACS, SciELO and Adolec, considered to be relevant to the achievement of bibliometric studies, such as this; because, in addition to presenting important indicators to reflect on the theme and target audience in question, can provide further studies with analysis of other indicators. A bibliometric analysis was configured as a technological methodology capable of displaying search patterns and identifying trends. Despite being an important methodology in the scientific environment in databases used, no articles were found of this kind, on the theme presented in this study.

Referring to the main results and conclusions recorded from the analysis, this study points to the need for studies that present actions that can be performed in the school environment together with students, families and society, and are worked in different ways the theme: alcohol, tobacco and other drugs. It is also necessary to conduct research in other databases, not cited in this survey, in order to provide more indicators to understand the factors that are associated with drug use, something that is becoming a reality ever more worrying in Brazil.

It is suggested that, when dealing with school health with emphasis on the use of alcohol, tobacco and other drugs, the PSE is addressed and that its actions can be cited as a strategy for promoting health and preventing use of substances such as those studied in this research after all, that program was established as seen previously, in order to articulate the health of the school to the educational process and minimize the use of these drugs among them.
