OBJECTIVE: to analyze the scientific evidence about pediatric palliative care. 

METHOD: this is a bibliometric study of Brazilian publications with 23 articles available online, between 2012 and 2016 in the LILACS, MEDLINE and BDBENF databases analyzed by simple descriptive statistics in figures and later according to content analysis. 

RESULTS: the articles found are in journals B1 and B2, with publications in 2014. The most studied subjects were nurses and nursing staff and the most indexed descriptors were palliative care, child, oncological nursing, nursing, child health, and neoplasms. All of them referred to the oncology and evidence for humanistic support: caregiver care, oncological pain control, engendering care for recreational activities and maintaining effective communication with staff, children, and family. 

CONCLUSION: the analysis showed a literature focused on oncology and caregiver care, revealing still low publication of other chronic conditions in pediatrics. The themes that may contribute to the advancement of nursing in later studies are an expansion of care plans for specific symptoms; research on administration and management; typification and content of the communication during hospitalization; and complexity of the hospital and home care network. 

Descriptors: Bibliometrics; Palliative Care; Pediatrics; Pediatric Nursing; Child; Chronic Disease.

ABSTRACT

Objetivo: analizar las evidencias científicas acerca de los cuidados paliativos pediátricos. Método: estudio bibliométrico de publicaciones brasileiras realizado con 23 artigos disponíveis on-line, no período de 2012 a 2016 nas bases de dados LILACS, MEDLINE e BDENF, analisados pela estatística descritiva simples em figuras e posteriormente segundo análise de conteúdo. Resultados: os artigos encontrados estão em revistas B1 e B2 majoritariamente, com publicações no ano de 2014. Os sujeitos mais estudados foram enfermeiros e equipe de enfermagem e os descritores mais indexados: cuidados paliativos, criança, enfermagem oncológica, enfermagem, saúde da criança e neoplasias. A totalidade referiu-se a oncologia e as evidências para o suporte humanístico: assistência ao cuidador, controle da dor oncológica, engendrar cuidados com vista em atividades lúdicas e manter comunicação eficaz com a equipe, criança e família. 

Conclusão: a análise mostrou uma literatura focada na oncologia e assistência ao cuidador, revelando ainda baixa publicação de outras condições crônicas na pediatria. Os temas que podem contribuir para o avanço da enfermagem em estudos posteriores são: ampliações de planos de cuidados para sintomas específicos; pesquisas sobre a administração e gestão; tipificações e o conteúdo da comunicação na internação; e complexidade da rede de atendimento hospitalar e domiciliar. 

Descritores: Bibliométrica; Cuidados Paliativos; Pediatría; Enfermagem Pediátrica; Criança; Doença Crónica.

RESUMEN

Objetivo: analizar las evidencias científicas acerca de los cuidados paliativos pediátricos. Método: estudio bibliométrico de publicaciones brasileiras realizado con 23 artículos disponibles online, en el período de 2012 a 2016 en las bases de datos LILACS, MEDLINE y BDENF analizados por la estadística descriptiva simple en figuras y posteriormente según análisis de contenido. Resultados: los artículos encontrados están en revistas B1 y B2 mayoritariamente, con publicaciones en 2014. Los sujetos más estudiados fueron enfermeros y equipo de enfermería y los descritores más indexados fueron cuidados paliativos, niño, enfermería oncológica, enfermería, salud del niño y neoplasias. La totalidad apuntó a la oncología y las evidencias para el soporte humanístico: asistencia al cuidador, control del dolor oncológico, engendrar cuidados para actividades lúdicas y mantener comunicación eficaz con el equipo, niño y familia. 

Conclusión: el análisis mostró una literatura enfocada en la oncología y asistencia al cuidador, revelando aún baja publicación de otras condiciones crónicas en la pediatría. Los temas que pueden contribuir para el avance de la enfermería en estudios posteriores son: ampliaciones de planos de cuidados para síntomas específicos; investigaciones sobre la administración y gestión; tipificaciones y el contenido de la comunicación en la internación; y complejidad de la red de atendimiento hospitalario y domiciliario. 

Descritores: Bibliométrica; Cuidados Paliativos; Pediatría; Enfermagem Pediátrica; Criança; Doença Crónica.
INTRODUCTION

The basic components of palliative care include proximity and warmth, dignity and pain relief. In pediatrics neonatal, nurses need to be at the forefront of these contingencies for care. It is considered that in the Brazilian reality among the causes of death maternal there are perinatal factors (prematurity, asphyxia/hypoxia, perinatal infections, respiratory diseases, perinatal cardiovascular disorders and maternal diseases), congenital malformations, child infections, immunopreventable diseases, external causes and malformed causes.

A child affected by a chronic disease is considered when a disease is diagnosed and treated in the first years of life, comprising durable and non-specific time, having difficulties in the family routine and also, its transition from childhood to adolescence attending health services. The health system and its professionals must adequately visualize the therapeutic possibilities, including the genetic predisposition and the influencing factors preneonatal and postneonatal.

Pediatric palliative care is categorized into three levels: Basic, whose professionals have a postgraduate degree in pediatrics, identifying children with palliative needs and referencing them quickly to higher levels of care; Generalist, whose professionals are interested in in palliative care courses for children and can structure human resources training plans and/or individual plans for interventions in sick children; Specialized, whose professionals have specialized training, passing through the other levels, performing research in the area and providing care in complex cases.

Factors such as leadership are highlighted in nursing work in specialized clinics to guide the team's work during the hospitalization period, depth of clinical knowledge, self-reflection, and awareness about the work. “Make a difference” during their care service encompasses aspects relating to the family, supporting them, and managing the symptoms of their children individually.

In this study, the term pediatrics is used to denote the age range from 0 to 19 years old, encompassing the concept of adolescence according to WHO, respecting the following respective age groups: neonatal or newborn - 0 to 28 days; infant - 29 days to 12 days; infant - 1 to 3 years old; preschool - 3 to 6 years old; school - 6 to 11 or 12 years old; adolescent - 11 to 19 years old.

OBJECTIVE

- To analyze the scientific evidence on pediatric palliative care.

METHOD

This is a bibliometric study using the quantitative analysis of the publications to give subsidy to the formulation of new scientific research. It is divided into three stages, beginning with two quantitative stages: 1) synopsis of titles and other information 2) display of figures for percentage discussion; and a descriptive stage: 3) discussion based on recurrent themes on pediatric palliative care.

The articles were surveyed by two independent reviewers in the months of June and July of 2017. In the development of the study, a search and review protocol for articles was used: 8 identification of the theme and selection of the research question; establishment of criteria for inclusion and exclusion of studies; selection of information to be extracted according to the validated template form, 9 evaluation of the included studies according to the seven levels of evidence, interpretation of the results and the presentation of the synthesis of knowledge.

The search was carried out through a search through Online access in important database systems in the context of Brazilian
Souza TCF, Correa Júnior AJS, Santana ME et al.

Pediatric palliative care: analysis of nursing...

Construction of graphs; Presentation and interpretation of data and Discussion. The second analysis was guided by the technique of Content Analysis to discuss the content of articles.

The authorship of the researched articles was assured using only surnames of the authors to contemplate the ethical aspects. Because it is a type of documentary study whose data are of a public nature, all the ethical precepts involved in relation to the analysis and dissemination of the research data were respected.

RESULTS

There were 177 articles found, and 154 of the articles were about the topic of palliative care and/or did not contribute to nursing. In the case of repetitions of publications between the databases, the LILACS database was chosen. Twenty-three articles relevant to the objectives were selected for analysis.

The distribution by database: LILACS (n=18), BDENF (n=3), MEDLINE (n=2) (Figure 1). Figure 2 was used for the interpretation of the data and synthesis.

Figure 2. Distribution of articles related to palliative nursing care in pediatrics. Belém (PA), Brazil, 2017.
Two of the 23 studies are literature review in databases (A4 and A5). Therefore, remaining 21 original research articles as sample universe/100% is observed according to figure 2 a preference for the choice of nurses (n=6/28, 57%) and the components of the nursing team (n=6/28, 57%) as studied subjects. About the family nucleus and the multi-professional team, three articles were obtained (14.28%); mothers, nursing students, and chronically ill children requiring palliative care, with only one study each (n=1/4, 76%). Of this sample universe/100% (n=21/100%) have a level of evidence VI, that is, all the studies were qualitative and/or descriptive.

Direcionaram-se majoritariamente as publicações para periódicos B1 (n=10/43.47%) e B2 (n=6/26.08%), e o quantitativo em periódicos A1 (n=2/8.69%), A2 (n=4/17.39%) e B3 (n=1/4.34%) (Figura 4). Sobreleva-se a relevância da publicação do tema em periódicos cujo QUALIS possua algum valor atribuído, atestando a qualidade das pesquisas científicas. Tal sistema valorizado na realidade brasileira oferece uma visão fidedigna da qualidade da produção dos programas de pós-graduação brasileiros.

Most journals were published for journals B1 (n=10/43.47%) and B2 (n=6/26.08%), and quantitative journals A1 (n=2/8.69%), A2 (n=4/17.39%) and B3 (n=1/4.34%) (Figure 4). The relevance of the publication of the subject in papers whose QUALIS has some value attributed, attesting the quality of the scientific research is surpassed. Such a system valued in the Brazilian reality offers a reliable view of the quality of the production of Brazilian graduate programs.

**Figure 3. Subjects of research on palliative nursing care in pediatrics. Belém (PA), Brazil, 2017.**

**Figure 4. Qualis CAPES (Quadrennium 2013/2016) of the publications. Belém (PA), Brazil, 2017.**
The articles found are mostly well indexed, judging by the most used descriptors according to the DECS in them: palliative care (n=21), child (n=10) and oncological nursing (n=6), nursing (n=6), (n=6) and neoplasms (n=6) (Figure 5). The southeastern region has the highest number of studies. The states of Rio de Janeiro (RJ), São Paulo (SP) and Rio Grande do Sul (RS) in the southern region of the country presented the highest number of publications on the subject in question between 2012 and 2016, respectively: 8/34, 78%; 5/21.73%; 4/17.39%.

**DISCUSSION**

It was observed that all the studies deal with the palliative care of the child in the oncological perspective. As far as pediatric cancer is concerned, it is reported that this is the second cause of death between 0 and 14 years old, only after accidents and although the prospect of a cure is high the infant mortality rate is still very high and stems from unknown causes. Therefore, it is a major public health problem today.

It was observed that it is important not only to turn to the child to direct an accurate look at caregiver, because in palliative care the focus of attention is the patient-family binomial since it constitutes as care provider and receiver. In this context, the main caregiver is inserted, who are most often the parents, who are responsible for the child in a situation of dependency, often giving up their life.13-6

It has also been identified that the scientific productions related to childhood palliative care are centered on the hospital. Historically, when addressing health care in the terminal stage of any disease, Western culture immediately refers to hospital care. At the same time, this has been demystified due to the newly constructed conception that the home is comfortable, protective, and with a closer relationship between family and friends, making it easier to treat. In this way, the transfer of this patient, when possible, from hospital care to outpatient or home care needs to be carried out.17

The Brazilian Portuguese scientific literature points out that palliative care for the child is carried out to offering comfort, well-being, safety and quality improvement to a “good death” with measures that alleviate pain and suffering.12,14-8,19-29

The lack of comfort comes from distressing symptoms and/or anxiety and fear, nursing actions include defining a locus of control, implementing rest measures such as high or low bedside, music, the presence of a particular person or object, among planning long-term actions.10

It is extremely important to address the role of nursing in the child in palliative care that requires pain management and control of other symptoms since pain is one of the signs and symptoms that the cancer patient presents and reports the most. Support for the family, since the diagnosis of cancer, causes a shock perceived by the despair of parents who believe it to be an incurable disease by relating it to death. The treatment is currently based on the analgesic scale of the World Health Organization, promoting adaptation of analgesia interventions and pain levels. It is up to the nurse to assess and measure the complexity of oncologic pain, implementing the therapy considering the family in this context since the child is
suffering from fatigue, nausea, vomiting, dyspnea, constipation, anorexia, convulsions, anxiety, depression, agitation and confusion.12, 14-5,19-28,31-2.

In the case of chronic pain, the nursing priorities translate into the evaluation of the etiology and triggering factors, determining the response to pain through behaviors or mismatches, helping the patient to deal with pain through dynamics, pharmacological or complementary therapy and promoting well-being through the sense of inner control.30

More Brazilian studies that detect adjustments of nursing interventions for pain control and their distressing symptoms in the pediatric palliative patient are desirable to identify factors of relief and worsening of the clinical condition.

It is also the range of symptoms with complementary therapies, medications or interventions such as positioning, relaxation, massage and other measures to maintain the quality of life, since using a single therapeutic resource has not been shown to be efficient for pain control, mainly of the chronic type. The importance of the association of pharmacological therapy and pain relief with play, art, reading, music and recreational activities, as well as reception and listening by the professional are shown in studies of children and adolescents.31

Also, activities appropriate to the children's universe are offered as a game characterized as an essential activity for their motor, emotional, mental and social development and the way in which their feelings, anxieties and frustrations are actively communicated and expressed. It is noticed that care in pediatric oncology brings challenges to the team, their material resources, preparation to attend to the particularities of the children's universe.26

There is other evidence in the studies that confirms that communication is an instrument that facilitates health work among the team, and between the child and the family, and the nurse is responsible for the interaction, giving the participants information about the clinical picture and support. Although difficulties are encountered in establishing an effective communicative process, it is important to point out that nurses who work with patients with no prognosis of cure consider communication to be an important and effective therapeutic resource, being a humanizing link and facilitating the emotional balance between the child and his family in the face of this intricate moment.12,15,19, 20-1,25-6,32,34-8

Pediatric palliative care: analysis of nursing practice

This study is limited by using only the production of Brazilian literature in Portuguese.

CONCLUSION

There was a literature focused on oncology and caregiver care, also revealing a low publication of other chronic conditions in pediatrics. The themes that may contribute to the advancement of nursing in later studies are expansion of care plans for specific symptoms; research on nursing administration and management; typifications and the content of the communication in the interment both between the team and with the family; and exploring the complexity of the hospital and home care network.
